

This is a case study of garbage treatment bucket in New Zealand. It is a very simple system. Many holes are opened at the bottom of the upper bucket. (picture. 2). There is one small plastic ball which is placed up side down at the bottom of the bucket below. The small plastic cup can keep space for kitchen garbage juice. Another role of this cup is to make it easy to separate between the two buckets. Users are recommended to presses garbage strongly to keep anaerobic condition but it is very difficult to separate top bucket from under bucket if this small cup is absent.
